

Gear Share - Equipment Rental Platform

Project Documentation

Prepared by: Hamza
Date: March 2026

1. Introduction

Gear Share is a modern web platform for renting professional photography and videography equipment such as cameras, lenses, gimbals, drones, and flashes.

The main goal of the project is to solve a common problem faced by photographers and content creators in Egypt: the difficulty of accessing high-quality equipment at reasonable prices and for short periods.

Key Features:

- Browse and rent professional photography gear
- Fully functional shopping cart with add/remove/quantity update
- Smooth navigation to Checkout page
- Dark / Light Mode support
- Responsive design optimized for mobile phones and desktops
- Contact form with validation
- Back-to-top button and smooth scrolling

The project was built as a **Frontend-only** application to demonstrate strong JavaScript, Bootstrap, and modern web development skills.

2. Technologies Used

Technology	Usage
HTML5	Page structure
CSS3	Styling, animations, and responsive design
Bootstrap 5	Grid system, Offcanvas, Cards, Buttons
Vanilla JavaScript	Cart logic, DOM manipulation, events
Font Awesome 6	Icons
Google Fonts	Montserrat + Inter
SessionStorage	Saving cart data between pages
Tailwind CSS	Used only in Checkout page

Additional Tools:

- Bootstrap Bundle (JavaScript + Popper)
- Local/Session Storage for state management

3. Setup Instructions

1. **Download** all project files and keep them in one folder.
2. **Folder Structure** (important):

```
gear-share/├── index - Copy.html├── about.html├── equipment.html├── contact.html├── checkout.html├── style.css├── cart.js├── back-to-up.js├── light-mode.js├── nav.js├── form.js├── bootstrap/└── images/
```
3. **How to Run:**
 - Simply double-click on `index - Copy.html` to open it in your browser.
 - Recommended: Use **Live Server** extension in Visual Studio Code for better experience.
4. **Notes:**
 - No backend server is required.

- Cart data is saved using `sessionStorage`.
- After successful checkout, the cart is automatically cleared.

4. Code Structure Explanation

The project follows a clean and modular structure:

- `style.css` — All custom styles, Dark/Light mode, Media Queries, animations (including typewriter effect), and responsive adjustments (especially for mobile).
- `cart.js` — Core logic for the shopping cart (add items, change quantity, remove items, calculate total, save to storage, and navigate to checkout).
- `back-to-top.js` — Back to top button with smooth scroll.
- `light-mode.js` — Toggle between Dark and Light themes with localStorage persistence.
- `nav.js` — Navbar scroll effect (changes style when scrolling).
- `form.js` — Contact form validation with real-time error messages.
- `checkout.html + inline script` — Displays cart summary and handles fake payment submission.

How the Cart Works:

- Products are stored in a JavaScript array.
- When user adds an item → saved in `sessionStorage`.
- Cart count updates in real-time across all pages.
- "Proceed to Checkout" button redirects to `checkout.html` while preserving cart data.

The design is fully responsive, with special attention to making titles (`h1`) much smaller on mobile phones while keeping them large on tablets and desktops.

5. Reflection (What I Learned)

Working on **Gear Share** was a valuable learning experience that improved my frontend development skills significantly.

Key Learnings:

- Building a complete **shopping cart system** from scratch using only Vanilla JavaScript (no frameworks).
- Managing application state with `SessionStorage` and `LocalStorage`.
- Writing clean, modular, and reusable JavaScript code by separating concerns into different files.
- Deep understanding of **Bootstrap 5** components (Offcanvas, responsive grid, utilities).
- Advanced **Responsive Design** techniques, especially controlling font sizes on mobile vs desktop using Media Queries and Bootstrap classes.
- Implementing user-friendly features: Toast notifications, smooth scrolling, theme toggle, and form validation.
- Importance of good UX/UI details that make the website feel professional and polished.

Most Important Lesson:

“A beautiful interface is not enough — it must also be **functional, intuitive, and maintainable**.”

This project strengthened my ability to turn ideas into real, working web applications and prepared me for building more complex full-stack projects in the future.

Thank you for reviewing this project.

Gear Share — Making professional gear accessible to every creator.
